TEST ADDRESS: 123 MAIN STRFFT ANYTOWN. GFORGIA 30000

CERTIFICATE OF MOLD ANALYSIS

PREPARED FOR:

RESIDENTIAL INSPECTOR OF AMERICA

PHONE NUMBER: (770) 476-4963

EMAIL: INFO@RESIDENTIALINSPECTOR.COM

TEST LOCATION: SAMPLE REPORT **123 MAIN STREET ANYTOWN, GEORGIA 30000** CHAIN OF CUSTODY #: 52034724

COLLECTED: MON DECEMBER 14, 2015

RECEIVED: WED JUNE 10, 2015

REPORTED: WED JUNE 10, 2015

APPROVED BY: JOHN D. SHANE PH.D.,

LABORATORY MANAGER

VERSION: 1.0 (A VERSION NUMBER GREATER THAN ONE (1) INDICATES THAT THE DATA IN THIS REPORT HAS BEEN AMENDED)

EPA regulations or standards for airborne or surface mold concentrations have not been established. There are also no EPA regulations or standards for evaluating health effects due to mold exposure. Information about mold can be found at www.epa.gov/mold.

All samples were received in an acceptable condition for analysis unless noted specifically in the Comments section under a particular sample. All results relate only to the samples submitted for analysis.

A version greater than 1.0 indicates that the lab report has been revised.

FOR MORE INFORMATION, PLEASE CONTACT INSPECTORLAB AT (800) 544-8156 OR EMAIL ASK@INSPECTORLAB.COM

PREPARED FOR: RESIDENTIAL INSPECTOR OF AMERICA

Comments	normally taken outside a building to provide a baseline from which samples on the interior of the building are compared. Outside air is considered normal whatever the mold counts may be. Light Debris: The debris present in the sample likely had no effect on			Mold counts are within a NORMAL RANGE and there is no indication, based on the mold counts, that there is any exposure concern to the occupants. The LIGHT DEBRIS present in the sample likely had no effect on the accuracy of the mold count.			Mold concentrations in the air are ABNORMAL and based on the mold counts, you likely have a mold source from which spores are able to become airborne and are an exposure concern to the occupants. MODERATE DEBRIS: in the sample likely had limited affect on the accuracy of the mold count.			Presence of current or former MOLD GROWTH observed. EXPOSURE TO SPORES LIKELY and will continue if the growth is not removed. An active or intermittent water source will cause the mold to continue to grow if the water source is not eliminated.		

^{*} Indoor Problem Fungi are generally capable of growing on wetted building materials.

Spore types not listed in this report were not observed.

Background debris estimates the amount of non-spore particles. Increasing amount of debris will affect the accuracy of the spore counts. Total percent may not equal 100% due to rounding.

^{**} Non-Problem Fungi are less capable or do not grow on wetted building materials. They are commonly found in the air outside and infiltrate into indoor air naturally. High numbers of any one of these spore types as compared to the Control sample may indicate that they are growing on wetted building materials indoors.

TEST ADDRESS: 123 MAIN STREET ANYTOWN, GEORGIA 30000

Introduction

All spores found in indoor air are also normally found in outdoor air because most originate or live in the soil and on dead or decaying plants. Therefore, it is not unusual to find mold spores in indoor air. This Mold Glossary is only intended to provide general information about the mold found in the samples that were provided to the laboratory.

Alternaria

Outdoor Habitat: One of the most commonly observed spores in the outdoor air worldwide,

normally in low numbers.

Indoor Habitat: Capable of growing on a wide variety of substrates and manufactured products

found indoors when wetted.

Allergy Potential: Type I (hay fever, asthma), Type III (hypersensitivity pneumonitis), Common

cause of extrinsic asthma

Disease Potential: Not normally considered a pathogen, but can become so in

immunocompromised persons.

Toxin Potential: Several known

Comments: One of the most common and potent allergens in the indoor and outdoor air.

Seen in indoor air in low concentrations, probably as a result of outdoor air

infiltration and/or recycling of settled dust.

Ascospores

Outdoor Habitat: Soil and decaying vegetation, dead and dying insects. These spores constitute a

large part of the spores in the air and can be found in the air in very large numbers in the spring and summer, especially during and up to three (3) days

after a rain.

Indoor Habitat: Very few of fungi that produce ascospores grow indoors. Some fungi that

produce ascospores are recognizable by their spores and when observed are listed

under their own categories. Wetted wood and gypsum wallboard paper

Allergy Potential: Depends on the type of fungus producing the ascospores.

Disease Potential: Not normally pathogenic as a group

Toxin Potential: None known

Comments: Ascospores are produced from a very large group of fungi. Notable ascospores

that are considered problematic for indoor environments are Chaetomium, Peziza, and Ascotricha. If these types of ascspores are observed they will be listed

in the report under their own names.

PREPARED FOR: RESIDENTIAL INSPECTOR OF AMERICA

TEST ADDRESS: 123 MAIN STREET ANYTOWN, GEORGIA 30000

Basidiospores

Outdoor Habitat: These are mushroom spores and are common everywhere, especially in the late

summer and fall.

Indoor Habitat: Very wet wood products, especially on footer plates, basements, and crawlspaces.

Sometimes mushrooms can be observed growing in potted plants indoors.

Allergy Potential: Rarely reported, but some Type I (hay fever, asthma) and Type III

(hypersensitivity pneumonitis) has been reported.

Disease Potential: None known **Toxin Potential:** None known

Comments: This group includes wood rotting fungi, including dry rot (Serpula and Poria)

that are especially destructive to buildings. However, if these types of spores (dry rot group) are observed in the sample they are listed under their own names on

the report.

Bipolaris/Drechslera

Outdoor Habitat: Commonly observed spores in the outdoor air worldwide, normally in low

numbers.

Indoor Habitat: Wetted wood and gypsum wallboard paper

Allergy Potential: Type I (hay fever, asthma)

Disease Potential: Opportunistic pathogen in immunocompromised persons, not normally a

pathogen in healthy individuals.

Toxin Potential: None known

Comments: This category represents at least three genera, including Bipolaris, Drechslera,

and Exserohilum. This group cannot be consistently separated by spore

morphology alone.

Cladosporium

Outdoor Habitat: Soil and decaying vegetation

Indoor Habitat: Wetted wood and gypsum wallboard paper, paper products, textiles, rubber,

window sills

Allergy Potential: Type I (hay fever, asthma) - an important and common outdoor allergen

Disease Potential: Opportunistic pathogen in immunocompromised persons, not normally a

pathogen in healthy individuals.

Toxin Potential: Two known, but not highly toxic

Comments: The most commonly reported spore in the outdoor air worldwide. An important

and common allergen source.

PREPARED FOR: RESIDENTIAL INSPECTOR OF AMERICA

TEST ADDRESS: 123 MAIN STREET ANYTOWN, GEORGIA 30000

Cladosporium sphaerospermum

Outdoor Habitat: Dead or dying cellulosic materials like wood and leaves.

Indoor Habitat: A favorite place for this mold type to grow is on wetted or rotting window sills.

Also likes to grow on all type of wetted or rotting wood.

Allergy Potential: Type I (hay fever, asthma) - an important and common outdoor allergen

Disease Potential: Opportunistic pathogen in immunocompromised persons, not normally a

pathogen in healthy individuals.

Toxin Potential: None known

Comments: A common mold on wetted wood, especially on window sills. Not frequently

found in the air.

Curvularia

Outdoor Habitat: Soil and decaying vegetation

Indoor Habitat: Wetted wood and gypsum wallboard paper, many cellulytic substrates

Allergy Potential: Type I (hay fever, asthma), common cause of allergenic rhinitis

Disease Potential: Potential human pathogen in immunocompromised people

Toxin Potential: None known

Comments: None

Epicoccum

Outdoor Habitat: Soil and decaying vegetation

Indoor Habitat: Capable of growing on a wide variety of substrates and manufactured products

found indoors when wetted.

Allergy Potential: Type I (hay fever, asthma)

Disease Potential: None known
Toxin Potential: None known

Comments: Very common in outdoor air in the summer months, especially in the midwest

USA during harvest times.

PREPARED FOR: RESIDENTIAL INSPECTOR OF AMERICA

TEST ADDRESS: 123 MAIN STREET ANYTOWN, GEORGIA 30000

Nigrospora

Outdoor Habitat: Soil and decaying vegetation

Indoor Habitat: Wetted wood and gypsum wallboard paper

Allergy Potential: Type I (hay fever, asthma)

Disease Potential: None known **Toxin Potential:** None known

Comments: Rarely observed growing indoors

Penicillium

Outdoor Habitat: Soil and decaying vegetation, textiles, fruits

Indoor Habitat: Wetted wood and gypsum wallboard paper, textiles, leather

Allergy Potential: Type I (hay fever, asthma), Type III (hypersensitivity pneumonitis)

Disease Potential: Opportunistic pathogen in immunocompromised persons, not normally a

pathogen in healthy individuals.

Toxin Potential: Several known

Comments: Extremely common in indoor air, but without the fruiting bodies associated with

the spores will be listed as "Penicillium / Aspergillus" group.

Penicillium/Aspergillus

Outdoor Habitat: Soil and decaying vegetation, textiles, fruits. These spores are commonly observed

and are a normal part of outside air.

Indoor Habitat: Wetted wood and gypsum wallboard paper, textiles, leather, able to grow on

many types of substrates.

Allergy Potential: Type I (hay fever, asthma), Type III (hypersensitivity pneumonitis)

Disease Potential: Opportunistic pathogen in immunocompromised persons, not normally a

pathogen in healthy individuals.

Toxin Potential: Several known

Comments: Extremely common in indoor air. Grouped into this combination genus category

because they are not identifiable into their respective genera based solely on spore

type.

PREPARED FOR: RESIDENTIAL INSPECTOR OF AMERICA

TEST ADDRESS: 123 MAIN STREET ANYTOWN, GEORGIA 30000

Pithomyces

Outdoor Habitat: Soil and decaying vegetation and their spores are easily dispersed into the air by

wind

Indoor Habitat: Wetted wood and gypsum wallboard paper

Allergy Potential: None known **Disease Potential:** None known

Toxin Potential: One known (sporidesmin)

Comments: A very common spore type in the air. Can be a water indicator mold type indoors

Smut/Myxomycetes

Outdoor Habitat: Soil and decaying vegetation and wood, especially dead stumps and bark

Indoor Habitat: Not known to grow indoors, sometimes found on firewood

Allergy Potential: Type I (hay fever, asthma), rare

Disease Potential: None known **Toxin Potential:** None known

Comments: These two groups are difficult to distinquish due to their "round, brown"

morphology. Smuts are especially common in the environment and can be see in indoor air samples even during the winter in homes because the spores can get

trapped in carpets
